- Pythogorean Theorem: Side with length *a*
- Side with length b and right triangle
- $-c = \sqrt{a^2 + b^2}$
- This is generally true

x_1

Vector (Euclidean) Length

Definition

Suppose $\mathbf{v} \in \Re^J$. Then, we will define its length as

$$||\mathbf{v}|| = (\mathbf{v} \cdot \mathbf{v})^{1/2}$$

= $(v_1^2 + v_2^2 + v_3^2 + \dots + v_J^2)^{1/2}$

Initial guess \leadsto Distance metrics Properties of a metric: (distance function) $d(\cdot,\cdot)$. Consider arbitrary documents \boldsymbol{X}_i , \boldsymbol{X}_j , \boldsymbol{X}_k

Initial guess → Distance metrics

1)
$$d(\boldsymbol{X}_i, \boldsymbol{X}_j) \geq 0$$

Initial guess → Distance metrics

- 1) $d(X_i, X_j) \ge 0$
- 2) $d(\mathbf{X}_i, \mathbf{X}_j) = 0$ if and only if $\mathbf{X}_i = \mathbf{X}_j$

Initial guess → Distance metrics

- 1) $d(X_i, X_j) \ge 0$
- 2) $d(\boldsymbol{X}_i, \boldsymbol{X}_j) = 0$ if and only if $\boldsymbol{X}_i = \boldsymbol{X}_j$
- 3) $d(\boldsymbol{X}_i, \boldsymbol{X}_j) = d(\boldsymbol{X}_j, \boldsymbol{X}_i)$

Initial guess → Distance metrics

- 1) $d(X_i, X_j) \ge 0$
- 2) $d(\boldsymbol{X}_i, \boldsymbol{X}_j) = 0$ if and only if $\boldsymbol{X}_i = \boldsymbol{X}_j$
- 3) $d(\boldsymbol{X}_i, \boldsymbol{X}_j) = d(\boldsymbol{X}_j, \boldsymbol{X}_i)$
- 4) $d(\boldsymbol{X}_i, \boldsymbol{X}_k) \leq d(\boldsymbol{X}_i, \boldsymbol{X}_j) + d(\boldsymbol{X}_j, \boldsymbol{X}_k)$

Explore distance functions to compare documents Do we want additional assumptions/properties?

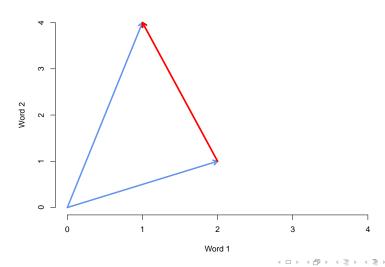

Euclidean Distance

Euclidean Distance

Euclidean Distance

Definition

The Euclidean distance between documents X_i and X_j as

$$||X_i - X_j|| = \sqrt{\sum_{m=1}^{J} (x_{im} - x_{jm})^2}$$

Definition

The Euclidean distance between documents X_i and X_j as

$$||X_i - X_j|| = \sqrt{\sum_{m=1}^{J} (x_{im} - x_{jm})^2}$$

Suppose $X_i = (1,4)$ and $X_j = (2,1)$. The distance between the documents is:

$$||(1,4) - (2,1)|| = \sqrt{(1-2)^2 + (4-1)^2}$$

= $\sqrt{10}$

Many distance metrics

Measuring the Distance Between Documents

Many distance metrics Consider the Minkowski family

Measuring the Distance Between Documents

Many distance metrics Consider the Minkowski family

Definition

The Minkowski Distance between documents X_i and X_j for value p is

$$d_p(\mathbf{X}_i, \mathbf{X}_j) = \left(\sum_{m=1}^J |x_{im} - x_{jm}|^p\right)^{1/p}$$

Manhattan metric

Manhattan metric

$$d_1(\mathbf{X}_i,\mathbf{X}_j) = \sum_{m=1}^J |x_{im} - x_{jm}|$$

Manhattan metric

$$d_1(\mathbf{X}_i, \mathbf{X}_j) = \sum_{m=1}^{J} |x_{im} - x_{jm}|$$
$$d_1((1,4), (2,1)) = |1| + |3| = 4$$

Manhattan metric

$$d_1(\mathbf{X}_i, \mathbf{X}_j) = \sum_{m=1}^{J} |x_{im} - x_{jm}|$$
$$d_1((1,4), (2,1)) = |1| + |3| = 4$$

Minkowski (p) metric

Manhattan metric

$$d_1(\mathbf{X}_i, \mathbf{X}_j) = \sum_{m=1}^{J} |x_{im} - x_{jm}|$$
$$d_1((1, 4), (2, 1)) = |1| + |3| = 4$$

Minkowski (p) metric

$$d_p(\mathbf{X}_i, \mathbf{X}_j) = \left(\sum_{m=1}^J |x_{im} - x_{jm}|^p\right)^{1/p}$$

$$d_p((1,4), (2,1)) = (|1-2|^p + |4-1|^p)^{1/p}$$

Increasing $p \rightsquigarrow$ greater importance of coordinates with largest differences

Increasing $p \rightsquigarrow$ greater importance of coordinates with largest differences If we let $p \rightarrow \infty$ Obtain maximum-metric (Chebyshev's Metric)

Increasing $p \rightsquigarrow$ greater importance of coordinates with largest differences If we let $p \rightarrow \infty$ Obtain maximum-metric (Chebyshev's Metric)

$$\lim_{p \to \infty} d_p(\mathbf{X}_i, \mathbf{X}_j) = \max_{m=1}^{J} |x_{im} - x_{jm}|$$

Increasing $p \leadsto$ greater importance of coordinates with largest differences If we let $p \to \infty$ Obtain maximum-metric (Chebyshev's Metric)

$$\lim_{p\to\infty} d_p(\mathbf{X}_i,\mathbf{X}_j) = \max_{m=1}^J |x_{im} - x_{jm}|$$

In words: distance between documents only the biggest difference

Increasing $p \leadsto$ greater importance of coordinates with largest differences If we let $p \to \infty$ Obtain maximum-metric (Chebyshev's Metric)

$$\lim_{p \to \infty} d_p(\mathbf{X}_i, \mathbf{X}_j) = \max_{m=1}^{J} |x_{im} - x_{jm}|$$

In words: distance between documents only the biggest difference All other differences do not contribute to distance measure

Increasing $p \leadsto$ greater importance of coordinates with largest differences If we let $p \to \infty$ Obtain maximum-metric (Chebyshev's Metric)

$$\lim_{p \to \infty} d_p(\mathbf{X}_i, \mathbf{X}_j) = \max_{m=1}^{J} |x_{im} - x_{jm}|$$

In words: distance between documents only the biggest difference All other differences do not contribute to distance measure

Suppose
$$X_i = (10, 4, 3)$$
, $X_j = (0, 4, 3)$, and $X_k = (0, 0, 0)$

$$d_1(\boldsymbol{X}_i,\boldsymbol{X}_j) = 10$$

$$d_1(\mathbf{X}_i, \mathbf{X}_j) = 10$$

 $d_1(\mathbf{X}_i, \mathbf{X}_k) = 10 + 4 + 3 = 17$

$$d_1(\mathbf{X}_i, \mathbf{X}_j) = 10$$

 $d_1(\mathbf{X}_i, \mathbf{X}_k) = 10 + 4 + 3 = 17$
 $d_2(\mathbf{X}_i, \mathbf{X}_j) = 10$

$$d_1(\mathbf{X}_i, \mathbf{X}_j) = 10$$

$$d_1(\mathbf{X}_i, \mathbf{X}_k) = 10 + 4 + 3 = 17$$

$$d_2(\mathbf{X}_i, \mathbf{X}_j) = 10$$

$$d_2(\mathbf{X}_i, \mathbf{X}_k) = \sqrt{10^2 + 4^2 + 3^2} = \sqrt{125} = 11.18$$

$$d_1(\mathbf{X}_i, \mathbf{X}_j) = 10$$

$$d_1(\mathbf{X}_i, \mathbf{X}_k) = 10 + 4 + 3 = 17$$

$$d_2(\mathbf{X}_i, \mathbf{X}_j) = 10$$

$$d_2(\mathbf{X}_i, \mathbf{X}_k) = \sqrt{10^2 + 4^2 + 3^2} = \sqrt{125} = 11.18$$

$$d_4(\mathbf{X}_i, \mathbf{X}_i) = 10$$

$$d_{1}(\boldsymbol{X}_{i}, \boldsymbol{X}_{j}) = 10$$

$$d_{1}(\boldsymbol{X}_{i}, \boldsymbol{X}_{k}) = 10 + 4 + 3 = 17$$

$$d_{2}(\boldsymbol{X}_{i}, \boldsymbol{X}_{j}) = 10$$

$$d_{2}(\boldsymbol{X}_{i}, \boldsymbol{X}_{k}) = \sqrt{10^{2} + 4^{2} + 3^{2}} = \sqrt{125} = 11.18$$

$$d_{4}(\boldsymbol{X}_{i}, \boldsymbol{X}_{j}) = 10$$

$$d_{4}(\boldsymbol{X}_{i}, \boldsymbol{X}_{k}) = \sqrt{10^{4} + 4^{4} + 3^{4}} = (10337)^{1/4} = 10.08$$

$$d_{1}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{1}(\mathbf{X}_{i}, \mathbf{X}_{k}) = 10 + 4 + 3 = 17$$

$$d_{2}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{2}(\mathbf{X}_{i}, \mathbf{X}_{k}) = \sqrt{10^{2} + 4^{2} + 3^{2}} = \sqrt{125} = 11.18$$

$$d_{4}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{4}(\mathbf{X}_{i}, \mathbf{X}_{k}) = \sqrt{10^{4} + 4^{4} + 3^{4}} = (10337)^{1/4} = 10.08$$

$$d_{\infty}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{1}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{1}(\mathbf{X}_{i}, \mathbf{X}_{k}) = 10 + 4 + 3 = 17$$

$$d_{2}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{2}(\mathbf{X}_{i}, \mathbf{X}_{k}) = \sqrt{10^{2} + 4^{2} + 3^{2}} = \sqrt{125} = 11.18$$

$$d_{4}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{4}(\mathbf{X}_{i}, \mathbf{X}_{k}) = \sqrt{10^{4} + 4^{4} + 3^{4}} = (10337)^{1/4} = 10.08$$

$$d_{\infty}(\mathbf{X}_{i}, \mathbf{X}_{j}) = 10$$

$$d_{\infty}(\mathbf{X}_{i}, \mathbf{X}_{k}) = 10$$

 σ^2 = determines sensitivity of the kernel

If $\boldsymbol{X}_i = \boldsymbol{X}_i$ then $k(\boldsymbol{X}_i, \boldsymbol{X}_i) = 1$

As X_i and X_j become more dissimilar, then $k(X_i, X_j) = 0$

Definition

Suppose we have documents X_i and X_j . Define the Gaussian kernel as

$$k(\boldsymbol{X}_i, \boldsymbol{X}_j) = \exp\left(-\frac{||\boldsymbol{X}_i - \boldsymbol{X}_j||^2}{\sigma^2}\right)$$

Kernel of the Gaussian distribution

 $\sigma^2 = \text{determines}$ sensitivity of the kernel

If
$$\boldsymbol{X}_i = \boldsymbol{X}_j$$
 then $k(\boldsymbol{X}_i, \boldsymbol{X}_j) = 1$

As X_i and X_j become more dissimilar, then $k(X_i, X_j) = 0$

Result → often justify setting some kernel weights to zero

Suppose all of our documents $\boldsymbol{X}_i \in \Re^J$

Suppose all of our documents $\mathbf{X}_i \in \Re^J$ There may be some mapping $\phi : \Re^J \to \Re^M$ where M > J that improves our performance "lift" to higher dimension

Suppose all of our documents $\mathbf{X}_i \in \Re^J$ There may be some mapping $\phi: \Re^J \to \Re^M$ where M > J that improves our performance "lift" to higher dimension We might want, then,

Suppose all of our documents $\mathbf{X}_i \in \Re^J$ There may be some mapping $\phi: \Re^J \to \Re^M$ where M > J that improves our performance "lift" to higher dimension We might want, then,

$$s(\phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j)) = \langle \phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j) \rangle$$

Suppose all of our documents $\mathbf{X}_i \in \Re^J$ There may be some mapping $\phi: \Re^J \to \Re^M$ where M > J that improves our performance "lift" to higher dimension We might want, then,

$$s(\phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j)) = \langle \phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j) \rangle$$

- The only thing we care about, though is inner product of transformed variables

Suppose all of our documents $\mathbf{X}_i \in \Re^J$ There may be some mapping $\phi: \Re^J \to \Re^M$ where M > J that improves our performance "lift" to higher dimension We might want, then,

$$s(\phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j)) = \langle \phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j) \rangle$$

- The only thing we care about, though is inner product of transformed variables
- → So long as we can calculate inner product, we need not make explicit transformation

Suppose all of our documents $\boldsymbol{X}_i \in \Re^J$ There may be some mapping $\phi: \Re^J \to \Re^M$ where M > J that improves our performance "lift" to higher dimension We might want, then,

$$s(\phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j)) = \langle \phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j) \rangle$$

- The only thing we care about, though is inner product of transformed variables
- \leadsto So long as we can calculate inner product, we need not make explicit transformation
- \leadsto Kernels provide methods for capture wide array of transformations.

Suppose all of our documents $\mathbf{X}_i \in \Re^J$ There may be some mapping $\phi: \Re^J \to \Re^M$ where M > J that improves our performance "lift" to higher dimension We might want, then,

$$s(\phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j)) = \langle \phi(\boldsymbol{X}_i), \phi(\boldsymbol{X}_j) \rangle$$

- The only thing we care about, though is inner product of transformed variables
- → So long as we can calculate inner product, we need not make explicit transformation
- \leadsto Kernels provide methods for capture wide array of transformations.
- Kernel Trick \leadsto calculate inner products on untransformed data (Gaussian Kernel), implicitly use wide array of ϕ 's.

Are all words created equal?

- Treat all words equally

- Treat all words equally

Inverse document frequency:

What properties do words need to separate concepts?

- Used frequently
- But not too frequently

Ex. If all statements about OBL contain Bin Laden than this contributes nothing to similarity/dissimilarity measures

Inverse document frequency:

 $n_j = No.$ documents in which word j occurs

What properties do words need to separate concepts?

- Used frequently
- But not too frequently

Ex. If all statements about OBL contain Bin Laden than this contributes nothing to similarity/dissimilarity measures

Inverse document frequency:

$$n_j = No.$$
 documents in which word j occurs $idf_j = log \frac{N}{n_j}$

What properties do words need to separate concepts?

- Used frequently
- But not too frequently

Ex. If all statements about OBL contain Bin Laden than this contributes nothing to similarity/dissimilarity measures

Inverse document frequency:

$$n_j = No.$$
 documents in which word j occurs $idf_j = log \frac{N}{n_j}$ $idf = (idf_1, idf_2, ..., idf_J)$

Why log?

Why log?

- Maximum at $n_j=1$

Why log?

- Maximum at $n_i = 1$
- Decreases at rate $\frac{1}{n_i} \Rightarrow$ diminishing "penalty" for more common use

Weighting Words: TF-IDF Weighting

Why log?

- Maximum at $n_j = 1$
- Decreases at rate $\frac{1}{n_i} \Rightarrow$ diminishing "penalty" for more common use
- Other functional forms are fine, embed assumptions about penalization of common use

$$\mathbf{X}_{i,\mathrm{idf}} \equiv \underbrace{\mathbf{X}_{i}}_{\mathrm{tf}} \times \mathrm{idf} = (X_{i1} \times \mathrm{idf}_{1}, X_{i2} \times \mathrm{idf}_{2}, \dots, X_{iJ} \times \mathrm{idf}_{J})$$

$$\begin{aligned} \mathbf{X}_{i,\mathrm{idf}} &\equiv \underbrace{\mathbf{X}_{i}}_{\mathrm{tf}} \times \mathrm{idf} &= (X_{i1} \times \mathrm{idf}_{1}, X_{i2} \times \mathrm{idf}_{2}, \dots, X_{iJ} \times \mathrm{idf}_{J}) \\ \mathbf{X}_{j,\mathrm{idf}} &\equiv \mathbf{X}_{j} \times \mathrm{idf} &= (X_{j1} \times \mathrm{idf}_{1}, X_{j2} \times \mathrm{idf}_{2}, \dots, X_{jJ} \times \mathrm{idf}_{J}) \end{aligned}$$

How Does This Matter For Measuring Similarity/Dissimilarity?

$$\mathbf{X}_{i,\mathrm{idf}} \equiv \underbrace{\mathbf{X}_{i}}_{\mathrm{tf}} \times \mathrm{idf} = (X_{i1} \times \mathrm{idf}_{1}, X_{i2} \times \mathrm{idf}_{2}, \dots, X_{iJ} \times \mathrm{idf}_{J})$$

$$\mathbf{X}_{j,\mathrm{idf}} \equiv \mathbf{X}_{j} \times \mathrm{idf} = (X_{j1} \times \mathrm{idf}_{1}, X_{j2} \times \mathrm{idf}_{2}, \dots, X_{jJ} \times \mathrm{idf}_{J})$$

How Does This Matter For Measuring Similarity/Dissimilarity? Inner Product

$$\mathbf{X}_{i,\mathrm{idf}} \equiv \underbrace{\mathbf{X}_{i}}_{\mathrm{tf}} \times \mathrm{idf} = (X_{i1} \times \mathrm{idf}_{1}, X_{i2} \times \mathrm{idf}_{2}, \dots, X_{iJ} \times \mathrm{idf}_{J})$$

$$\mathbf{X}_{j,\mathrm{idf}} \equiv \mathbf{X}_{j} \times \mathrm{idf} = (X_{j1} \times \mathrm{idf}_{1}, X_{j2} \times \mathrm{idf}_{2}, \dots, X_{jJ} \times \mathrm{idf}_{J})$$

How Does This Matter For Measuring Similarity/Dissimilarity? Inner Product

$$\mathbf{X}_{i,\mathrm{idf}} \cdot \mathbf{X}_{j,\mathrm{idf}} = (\mathbf{X}_i \times \mathrm{idf})' (\mathbf{X}_j \times \mathrm{idf})$$

$$\mathbf{X}_{i,\mathrm{idf}} \equiv \underbrace{\mathbf{X}_{i}}_{\mathrm{tf}} \times \mathrm{idf} = (X_{i1} \times \mathrm{idf}_{1}, X_{i2} \times \mathrm{idf}_{2}, \dots, X_{iJ} \times \mathrm{idf}_{J})$$

$$\mathbf{X}_{j,\mathrm{idf}} \equiv \mathbf{X}_{j} \times \mathrm{idf} = (X_{j1} \times \mathrm{idf}_{1}, X_{j2} \times \mathrm{idf}_{2}, \dots, X_{jJ} \times \mathrm{idf}_{J})$$

How Does This Matter For Measuring Similarity/Dissimilarity?

Inner Product

$$\mathbf{X}_{i,\mathrm{idf}} \cdot \mathbf{X}_{j,\mathrm{idf}} = (\mathbf{X}_i \times \mathbf{idf})'(\mathbf{X}_j \times \mathbf{idf})$$

$$= (\mathrm{idf}_1^2 \times X_{i1} \times X_{j1}) + (\mathrm{idf}_2^2 \times X_{i2} \times X_{j2}) + \dots + (\mathrm{idf}_J^2 \times X_{iJ} \times X_{jJ})$$

Define:

Define:

$$\mathbf{\Sigma} = \begin{pmatrix} \mathsf{idf}_1^2 & 0 & 0 & \dots & 0 \\ 0 & \mathsf{idf}_2^2 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & \mathsf{idf}_J^2 \end{pmatrix}$$

Define:

$$\mathbf{\Sigma} = \begin{pmatrix} idf_1^2 & 0 & 0 & \dots & 0 \\ 0 & idf_2^2 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & idf_J^2 \end{pmatrix}$$

If we use tf-idf for our documents, then

Define:

$$\mathbf{\Sigma} = \begin{pmatrix} idf_1^2 & 0 & 0 & \dots & 0 \\ 0 & idf_2^2 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & idf_J^2 \end{pmatrix}$$

If we use tf-idf for our documents, then

$$d_2(\boldsymbol{X}_i, \boldsymbol{X}_j) = \sqrt{\sum_{m=1}^{J} (x_{im,idf} - x_{jm,idf})^2}$$
$$= \sqrt{(\boldsymbol{X}_i - \boldsymbol{X}_j)' \boldsymbol{\Sigma} (\boldsymbol{X}_i - \boldsymbol{X}_j)}$$

Final Product

Applying some measure of distance, similarity (if symmetric) yields:

$$\mathbf{D} = \begin{pmatrix} 0 & d(1,2) & d(1,3) & \dots & d(1,N) \\ d(2,1) & 0 & d(2,3) & \dots & d(2,N) \\ d(3,1) & d(3,2) & 0 & \dots & d(3,N) \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ d(N,1) & d(N,2) & d(N,3) & \dots & 0 \end{pmatrix}$$

Lower Triangle contains unique information N(N-1)/2

Similarity and Dissimilarity of Many Things

Throughout the course we'll measure similarity between documents We'll also (implicitly) study similarity of probability distributions

Develop a measure of distribution dissimilarity

Similarity of Probability Distributions

Definition

Suppose P is a continuous random variable with density $p: \Re \to \Re$ and Q is a continuous random variable with density $q: \Re \to q$. We can define the KL-Divergence between P and Q as

$$KL(P||Q) = \int_{-\infty}^{\infty} p(x) \log \frac{p(x)}{q(x)} dx$$

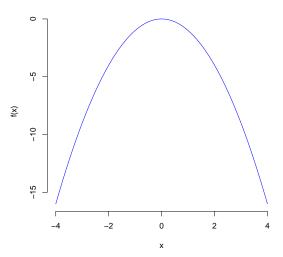

KL-divergence measures dissimilarity between two distributions.

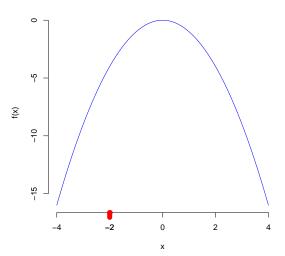

Consider a function. $f(x) = -x^2$.

Consider a function. $f(x) = -x^2$. Maps numbers to other numbers.

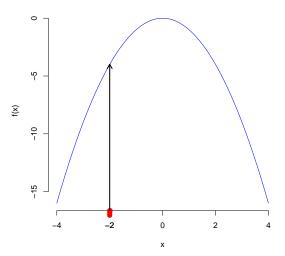

Consider a function. $f(x) = -x^2$. Maps numbers to other numbers.

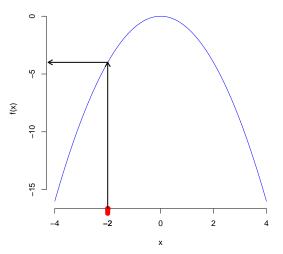

Take some input (-2 here)

Then obtain the value of f(-2)

Then obtain the value of f(-2) = -4

 $\mathsf{KL}(q||p)$ is a functional.

 $\mathsf{KL}(q||p)$ is a functional. A functional takes functions as inputs, returns a real number.

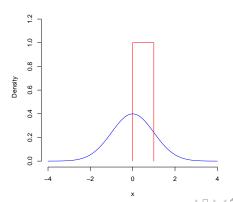

KL(q||p) is a functional. A functional takes functions as inputs, returns a real number.

 $\mathsf{KL}(q||p)$ maps from sets of distributions $q \in \mathcal{Q}$ and $p \in \mathcal{P}$ to positive real numbers.

KL(q||p) is a functional. A functional takes functions as inputs, returns a real number.

 $\mathsf{KL}(q||p)$ maps from sets of distributions $q \in \mathcal{Q}$ and $p \in \mathcal{P}$ to positive real numbers.

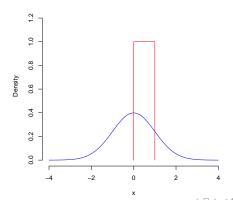

For example, we could set q = Uniform(0,1) and p = Normal(0, 1)

KL(q||p) is a functional. A functional takes functions as inputs, returns a real number.

 $\mathsf{KL}(q||p)$ maps from sets of distributions $q \in \mathcal{Q}$ and $p \in \mathcal{P}$ to positive real numbers.

For example, we could set q = Uniform(0,1) and p = Normal(0, 1) KL(Uniform(0,1)||Normal(0,1)) = 1.09

If q and p are the same distribution then KL(q||p) = 0.

If q and p are the same distribution then $\mathsf{KL}(q||p) = 0$. Variational Approximation (topic models!): approximate one distribution p, with another, simpler distribution q.

If q and p are the same distribution then KL(q||p) = 0.

Variational Approximation (topic models!): approximate one distribution p, with another, simpler distribution q.

Then make this approximation the best possible–minimize the KL-divergence.

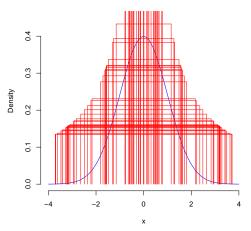

Approximate a Normal(0,1) with symmetric Uniform distribution, Uniform(-b, b).

Approximate a Normal(0,1) with symmetric Uniform distribution, Uniform(-b, b).

Choose b to min. KL(Uniform(-b, b)|| Normal(0,1))

Approximate a Normal(0,1) with symmetric Uniform distribution, Uniform(-b, b).

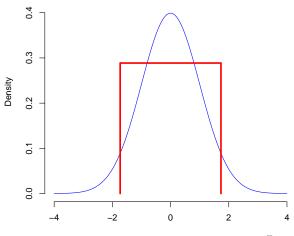

Choose b to min. KL(Uniform(-b, b)|| Normal(0,1))

Answer:

Answer: $b = \sqrt{3}$

Answer: $b = \sqrt{3}$
